

Framework Tutorial

Getting Started

Download the latest jar from [here](#).

Create New Project

```
> java -jar cunfum.jar startproject <ProjectName>
```

Above command will create a fresh project folder contains an example test case to search on google.

Run New Project

```
> cd <ProjectName>
> java -jar ../cunfum.jar Sanity.xml default.properties
```

It will run the google search example case in chrome browser.

Inbuilt Keywords:

NEW_DYNAMIC_ID

You may want some temporary value to be used as test data in runtime. For example if you want to test login functionality and you may want to create a fresh user every time test is executed you would need some dynamically generated text that you can pass. You can use NEW_DYNAMIC_ID keyword to generate a temp text for runtime like below:

```
> "My username is : {% NEW_DYNAMIC_ID %}" will be "My user name is Fer345" at runtime.
Now if you want to reuse that same string again somewhere else then you have to use keyword
"DYNAMIC_ID", notice that NEW_ has been removed.
```

```
> "My password for username {% DYNAMIC_ID %} is {% NEW_DYNAMIC_ID %}"
Will become "My password for username Fer345 is fd3SW"
```

NOTE: When we call NEW_DYNAMIC_ID in our script it will generate a new text and save it into DYNAMIC_ID variable. So if we call DYNAMIC_ID one more time in our script then it will be like this.

```
> "My password for username {% DYNAMIC_ID %} is {% DYNAMIC_ID %}"
Will be "My password for username fd3SW is fd3SW"
Notice that we lost "Fer345" because new value is assigned to DYNAMIC_ID.
```
